Over 15 years of professional software development across startups, fintech platforms, and consultancies have taken me through diverse environments and teams across Brazil and Australia. I've worked with Golang, Java, Ruby, TypeScript, and Kotlin in both on-premise and cloud environments (AWS, GCP), learning to adapt quickly to different organizational contexts and technical challenges.

This journey revealed that great software outcomes depend as much on collaboration as code. Agile principles—bringing people together, removing intermediaries, fostering direct communication—create the conditions for teams to solve complex problems effectively.

Today I specialize in event sourcing architectures, zero-downtime platform transformations, and adapting systems across multiple countries while balancing regulatory compliance with business delivery value. I combine technical practices (TDD, Continuous Delivery, DDD) with collaborative approaches (mob programming, trunk-based development) that enable teams to experiment, deliver incrementally, and maintain sustainable pace.

Recently, I've been developing and researching with AI, exploring how it impacts team dynamics, flow, software architecture, and collaboration patterns. If your organization needs hands-on help with event sourcing adoption, international platform expansion, or strengthening agile engineering practices, I bring proven experience from global platform transformations and legacy migrations.

Professional Experience

February 2025 - Present

Slice Pay - Staff Engineer - Sydney, Australia

Joined as the first dedicated engineer after a temporary engineer validated the market with a basic prototype (single API endpoint, Notion as database). My mandate was to transform this prototype into a production-grade application with robust features, scalability, and security.

The Notion-based system revealed critical bottlenecks: business processes built directly on top of Notion created deep coupling that required multiple iterations to decouple, poor technical and product observability, platform flakiness, and substantial manual operational overhead. Since Notion is not designed as a production database, removing this dependency was critical to avoid undermining the product's potential. After implementing initial features to enable sales, another engineer joined and I led the re-architecture of the entire system. Despite limited stakeholder availability, we conducted Event Storming workshops involving product, operations, sales, and marketing teams to inform the design.

The migration strategy prioritized zero business disruption: deployed event sourcing infrastructure from day one, initially emitting events in-memory while maintaining the existing API contract to avoid breaking client integrations. Once the flow was complete, activated event persistence and migrated historical Notion data to proper events, giving older bookings the same functionality as new ones.

This transformation achieved substantial reduction in manual operational and engineering work tracked by metrics, while enabling analytics capabilities through BigQuery projections that allowed teams to build dashboards and reports using low-code tools. All development maintained 24/7 availability with zero downtime throughout the transition.

- Fintech

August 2020 - February 2025

Indebted - Staff Engineer - Sydney, Australia

InDebted is a debt collection company that relies on data to provide a smarter and more sensible approach, supporting customers to get their financial life back on track.

During my tenure, I was instrumental in the platform's globalization efforts. First, expanding to Canada which required adapting the platform to meet Canadian regulatory requirements. Then leading the more complex expansion to the US market, ensuring compliance with US-specific debt collection regulations.

A key technical achievement was absorbing the legacy platform into the new event sourcing architecture. This migration preserved complete audit trails for old accounts and maintained data integrity and history for existing clients, ensuring no data loss during the transition.

Working within a team of 10 engineers, I collaborated primarily through pair and mob programming to tackle complex challenges. When timezone differences between US and Australia made mobbing impractical, we maintained regular check-ins to ensure alignment. Combined with trunk-based development, this approach resulted in minimal rework, low bug rates, and eliminated time spent on code reviews.

Throughout this work, I maintained the platform's 24/7 availability with zero downtime. The architecture enabled continuous experimentation and real-time impact measurement while ensuring the team could progress independently with fast releases and simple extensibility.

Dec 2018 - Aug 2020

Pragmateam - Software developer - Sydney, Australia

Worked as a consultant software engineer across two major engagements, helping organizations improve their technical practices and delivery capabilities.

At a large private company, I focused on frontend delivery using Angular, working closely with the team through pair programming to deliver features while applying TDD practices. I also provided architectural guidance on frontend codebase structure, helping establish patterns that improved code organization and maintainability.

At Service NSW (government agency), I joined a team with already strong TDD principles and focused on delivering features while upskilling the team on advanced testing strategies and CI/CD pipelines. The engagement involved practical work with Kotlin on an AWS-based platform, establishing deployment automation that improved their delivery capabilities.

Jul 2017 - Sep 2018

Bionexo - Software developer - São Paulo, Brazil

I worked within the legacy platform team, helping the team apply techniques described in the book "Working Effectively with Legacy Code". So, we introduced automated tests and improved the code base quality, solving years-long platform problems and improving user satisfaction. Furthermore, I was involved in the project to migrate from that legacy platform to a new one.

Feb 2015 - Jun 2017

ThoughtWorks - Software Developer - São Paulo, Brazil

I worked as a consultant embedded to the customer's office, influencing, and helping them to improve their agile process, implementing continuous-delivery, and coding skills.

Education

Computer Science. Universidade Presbiteriana Mackenzie [2005 - 2009]

Additional Experience

Caelum teacher of Object Oriented Programming for 6 months. That was a great experience of teaching in one of best "bootcamps"-like in Brazil.
